

De effecten van fluid responsiveness bepalen bij patiënten met ernstige sepsis

Yvanca van Welt
IC verpleegkundige
Circulation Practitioner i.o.

Inhoud

- * Inleiding
- * Aanleiding
- * Probleem-, doel- en vraagstelling

- * Literatuur onderzoek
- * Praktijkonderzoek
- * Conclusies en aanbevelingen

- * Literatuurlijst

Inleiding

- * Het Waterlandziekenhuis (WLZ) te Purmerend
- * Algemeen ziekenhuis, 275 bedden.
- * Intensive Care (IC), 7 bedden, 6 beademingen.
- * Niveau 1 IC

- * Beademingsdagen:
 - 2013: 946
 - 2014: 697

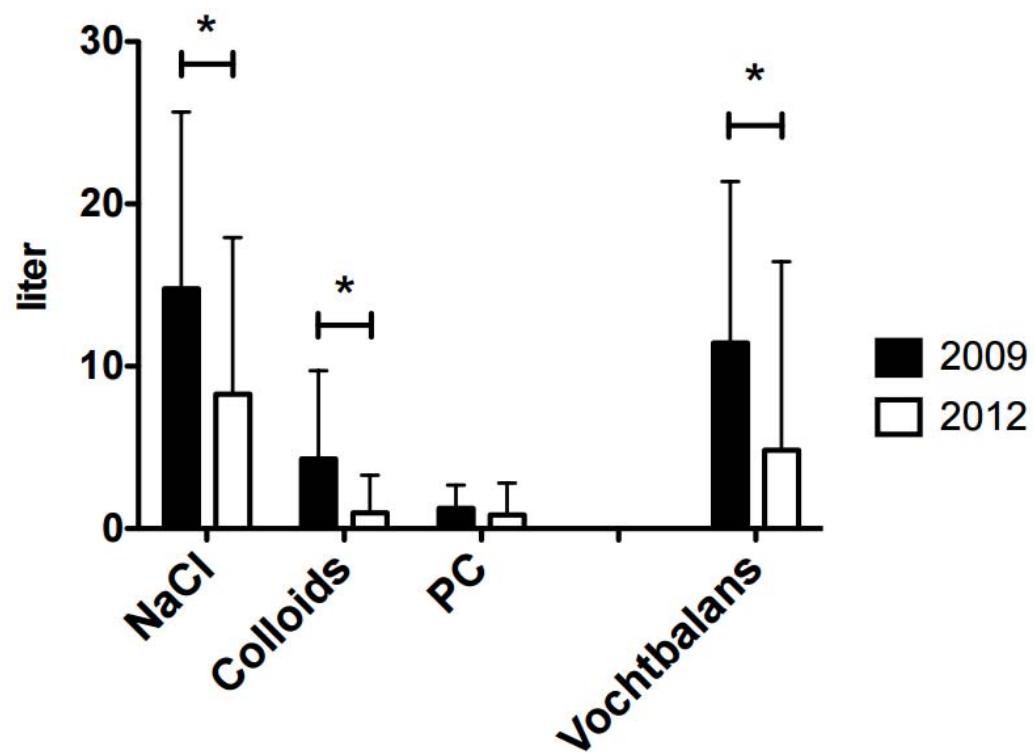

Aanleiding

- * Geen eenduidig beleid rondom vochtresuscitatie.
- * Geen protocol aanwezig
- * Vochtbalans positief

Aanleiding

Bron: Global Circulation: how we do it. J van Bommel, EMC Rotterdam

Probleemstelling

- * Er is geen eenduidig beleid omtrent vloeistofresuscitatie bij patiënten met ernstige sepsis, Wat resulteert in een positieve vochtbalans.

Doelstelling

- * Inzichtelijk krijgen of de vochtbalans 24 en 48 uur na vaststellen diagnose ernstige sepsis minder positief is wanneer fluid responsiveness bepaald wordt.

Vraagstelling

- * Leidt het bepalen van fluid responsiveness tot een lagere vochtbalans 24 en 48 uur na het vaststellen van de diagnose ernstige sepsis?

Literatuurstudie

Sepsis in European intensive care units: Results of the SOAP study*

Jean-Louis Vincent, MD, PhD, FCCM; Yasser Sakr, MB, BCh, MSc; Charles L. Sprung, MD; V. Marco Ranieri, MD; Konrad Reinhart, MD, PhD; Herwig Gerlach, MD, PhD; Rui Moreno, MD, PhD; Jean Carlet, MD, PhD; Jean-Roger Le Gall, MD; Didier Payen, MD; on behalf of the Sepsis Occurrence in Acutely Ill Patients Investigators

Conclusions: This large pan-European study documents the high frequency of sepsis in critically ill patients and shows a close relationship between the proportion of patients with sepsis and the intensive care unit mortality in the various countries. In addition to age, a positive fluid balance was among the strongest prognostic factors for death. Patients with intensive care unit acquired sepsis have a worse outcome despite similar severity scores on intensive care unit admission. (Crit Care Med 2006; 34:344–353)

Fluid chalLENges in Intensive CarE (FENICE Trial)

Intensive Care Med. 2015, V41:9:1529-1537. M. Cecconi, C Hofer et. al.

- * 2213 patiënten, 311 ziekenhuizen, 46 landen.
- * Data collectie voorjaar 2013
- * Publicatie resultaten september 2015

Doel vochtresuscitatie

- * Verbeteren Cardiac Output (CO).
- * Verbeteren van weefselperfusie.
- * Verhogen van zuurstofaanbod (DO_2) weefsels.

- 1: Klinische probleem oplossen door CO te verbeteren?
- 2: Zal vocht suppletie leiden tot verbetering CO?

Fig. 1
Further fluid administration post fluid challenge

Conclusie

- * Geen verlaging van vochtbalans.
- * Secundaire eindpunten geen verschil.
- * Mogelijke oorzaken:
 - kleine groepen
 - naleving protocol
- * Langere observatieperiode nodig.

Aanbevelingen

- * Data verzamelen continueren.
- * Grondlegging verbeteren.
- * Scholing sepsis.
- * Scholing fluid responsiveness.

Rol van de CP'er

- * Op de hoogte blijven ontwikkelingen.
- * Protocollen ontwikkelen en implementeren.
- * Optimaliseren proces sepsis.
- * EBP toepassen.
- * Kwaliteit rondom circulatie optimaliseren.
- * Deskundigheidsbevordering.
- * Onderzoek.
- * Bekwaamheid apparatuur.
- * Contact industrie.
- * Werkgroep circulatie.
- * Patiënt veiligheid op gebied hemodynamiek verhogen.
